The exterior of a building is largely the visible mark of a structure. It links outer and inner spaces, protects against the effects of weather, and certainly promotes lowering of a building's energy needs. More than ever, the exterior is becoming the testing ground for novel applications of new materials - e...

A skin-load dominated building has the largest proportion of space conditioning energy loads determined by the building enclosure. This type of building is characterized by a relatively low occupant density where internal heat generation is minimal (e.g., housing), and natural ventilation and daylighting may be easily accomplished.

While Green and Build may have some word fatigue, Biophilic Design is THE hot topic for building materials Emanating nature in a space, lots of literal green instead of just the word are really trending in materials. Texture is also the feel good feature of many building products. The hands on aesthetic is really taking off in building materials.

**News - CaraGreen**  
The concept of building skin [] originated only after the 19th century, when the industrial revolution brought to the world new materials and production methods increasingly liberating architecture from the constraint of the load-bearing wall.Examples of this change can be found beginning with iron and glass light-weight structures such as Paxton's Crystal Palace (1851), then in the American ...
