Classical Competing Risks 1st Edition

Written by a leading statistician, Classical Competing Risks thoroughly examines the probability framework and statistical analysis of data of Competing Risks. The author explores both the theory of the subject and the practicalities of fitting the models to data.

In engineering applications competing risks arise when analyzing series systems. Classical competing risks deal with the modeling of the probability of failure in the observed system (crude probabilities) or in systems with some causes of failure removed (net or partial crude probabilities).

In failure-time settings, a competing risk event is any event that makes it impossible for the event of interest to occur. For example, cardiovascular disease death is a competing event for prostate cancer death because an individual cannot die of prostate cancer once he has died of cardiovascular disease. Competing Risks Survival Analysis - Springer

In contrast, a classical approach to competing risks is via latent failure times as briefly summarized by Kalbfleisch and Prentice¹² (see Section 8.2.4). In that approach one imagines the existence of random variables, L_1 , L_2 , representing time to failure from Cause 1 and time to failure from Cause 2, respectively.

Competing risks in epidemiology: possibilities and pitfalls

The need to understand, interpret and analyse competing risk data is key to many areas of science, particularly medical research. There is a real need for a book that presents an

Bone marrow transplant (BMT) is a standard treatment for acute leukemia. Klein and Moeschberger present a set of BMT data for 137 patients, grouped into three risk categories based on their status at the time of transplantation: acute lymphoblastic leukemia (ALL), acute myelocytic leukemia (AML) low-risk, and AML high-risk. During the follow-up period, some patients might relapse or some ...

1. Introduction. Survival analysis with competing risks data is very common in the field of medical studies and now gaining more attention and interest in many research areas , , .For instance, a physician may be interested in time to death of a particular disease, but the patient can die from another competing disease(s) that may be potentially dependent or independent of disease of interest .

The relevance of competing risks in medical research is highlighted by methodological papers in various medical fields. We mention [3 - 5] as recent examples. A classical statistics textbook account has been given in the first edition of [6] in 1980, and a definite mathematical treatment based on counting processes is included in [7].

We also extend our comparative analysis to clustered competing risks data that are frequently used in medical studies. To facilitate the numerical comparison, we implement the computing algorithm for marginal Cox regression with clustered competing risks data in the R joint.Cox package and check its performance via simulations. For illustration ...
