The manual is for use by electric utility power plant personnel during the investigation into the cause of a boiler tube failure and during the evaluation of corrective actions to prevent future boiler tube failures. It is intended to aid plant personnel in their understanding of the basic failure mechanisms that can produce a boiler tube failure.

plates. The tube grade chosen by EDF was Admiralty Brass [B70/30AS, UNS C44300 (for loop circuit only)]. Following several operational cycles, tube material degradation symptoms were identified causing not only localized tube wall loss but more pronounced leaks resulting in entire tube failures. We can categorize these phenomena as the following.

In the early 1980s, the Electric Power Research Institute (EPRI) identified 22 mechanisms that could result in the failure of a boiler tube. One of those mechanisms involved corrosion fatigue. At that time, this mechanism was not well understood. Moreover, there were no permanent solutions to address this mechanism.

### **Analysis - HRST, Inc.**

Boiler tube failures are of immense concern to utility companies and boiler manufacturers. There are many reports regarding failure modes and mechanisms. Damage mechanisms which mostly contribute the maximum percentage of tube failures [3,7] are: Short-term overheating, high-temperature creep, caustic corrosion, and hydrogen damage. 1.1.
