Breast Ultrasound is a very common adjunct modality for diagnostic imaging of patients either being called back from a screening exam or those coming into our facilities with clinical symptoms. The job of the breast sonographer is to understand where the area of concern is located on the mammogram and how to correlate it to where they should be scanning in the patient's breast.

The median interval between mammography and diagnostic MR imaging was 22 days (range, 0–100 days); none of these 88 lesions had a mammographic correlate. Mammographic parenchymal density [13] was class 4 (dense) in 18 (20%), class 3 (heterogeneously dense) in 57 (65%), class 2 (scattered fibroglandular densities) in 12 (14%), and class 1 ...

The increased use of mammographic screening has led to increased detection of small, curable breast cancers that are amenable to breast-conserving surgery. Mammography and other imaging modalities, such as sonography and MRI, assist in the determination of the appropriateness of breast conservation and in the differentiation of recurrence from ...

There are several breast imaging modalities available such as Ultrasound, CT,Digital Mammography ,MRI and scintimammography . Mammography remains the cornerstone of breast imaging . Only mammography when correctly performed and interpreted offers the necessary reliability to diagnose the curable forms of breast cancers. Ultrasound,MRI , CT are useful adjuncts once a lesion has been detected by physical examination or by radiographic mammography .
