Life Under Your Feet: Measuring Soil Invertebrate ...

Invertebrates are animal groups that lack a vertebra, or backbone. Most invertebrates fall into one of six categories: sponges, jellyfish (this category also includes hydras, sea anemones, and corals), comb jellies, flatworms, mollusks, arthropods, segmented worms, and Echinoderms.

sampling. Soil and macroinvertebrates were sampled at five randomly selected locations in each home garden. At each location we dug out a 25 × 25 cm monoliths, with a depth of 30 cm, and following the TSBF method as described by Anderson and Ingram .From each monolith we took a representative sample to determine organic matter content,

Teacher Information:

Invertebrates are animals without a backbone. Of the planet's estimated 15-30 million animal species, 90% or more are invertebrates. Invertebrates live just about anywhere.
