Kelly betting or proportional betting is an application of information theory to investing and gambling. Its discoverer was John Larry Kelly, Jr.. Part of Kelly's insight was to have the gambler maximize the expectation of the logarithm of his capital, rather than the expected profit from each bet. This is important, since in the latter case, one would be led to gamble all he had when presented ...

Gambling theory, then, is primarily concerned with decision making under conditions of risk. The making of a decision—that is, the process of selecting among  $n$  strategies—implies several logical avenues of development. One implication is the existence of an expression of preference or ordering of the strategies.

Gambling theory is primarily concerned with decision making under conditions of risk. The act of making a decision consists of selecting one course of action, or strategy, from among the set of admissible strategies. Decisions can be categorized according to the relationship between action and outcome.

The mathematics of gambling are a collection of probability applications encountered in games of chance and can be included in game theory. From a mathematical point of view, the games of chance are experiments generating various types of aleatory events, the probability of which can be calculated by using the properties of probability on a finite space of events.
