Trace elements can have profound adverse effects on the health of people burning coal in homes or living near coal deposits, coal mines, and coal-burning power plants. Trace elements such as arsenic emitted from coal-burning power plants in Europe and Asia have been shown to cause severe health problems. Perhaps the most widespread health problems are caused by domestic coal combustion in ...

Trace Elements in Coal A Magical Journey Across the ...

Trace elements are present in coal ash because the parent coal from which the ash is derived also contains trace elements . as a result of natural formation processes. During combustion, most trace elements in the parent coal are retained in the residual coal ash and are concentrated in the smaller volume of the ash compared to the original ...

inorganic sulfur are pyrites and sulfates. Trace elements in coal were categorized into those found principally with the organic matter of coal and those found present principally in the mineral matter associated with coal. Upon conversion of coal to a coal liquid, most of the organic sulfur

Fuel Contaminants: Volume 1 - Chemistry

Based on the analyses of the minerals, trace elements and REEs, we try to find geochemical characteristics of the coal seam formation process. The analysis results indicate that the contents of ash and sulfur are low while the content of phosphor is comparatively high, and that the specific value of Al 2 O 3 /SiO 2 is relatively high and that ...

Late Paleozoic coal in North China and US coal. The results are shown in Table 1, from which we can get the characteristics of 22 trace elements in the No. 6 coal. 1. Enrichment factor (EF) is often used to evaluate element dispersion and enrichment (Gluskoter et al., 1977). EF values of each element can be seen from Table 1.

Table 4 presents the results of determination of the tested trace elements concentrations in the samples of charge coal and coke obtained from them. Concentrations of individual elements vary considerably. The lowest values, from a few to more than 100 ppb, are for Cd and Hg. The highest values, exceeding 100 ppm and 200 ppm, are Mn and Sr concentrations, respectively.
