Tumors Of The Eye And

Eye tumors, also known as ocular tumors, are tumors associated with the eye. A tumor is a collection of cells that grows abnormally, and it can be malignant or benign (non-cancerous). The most common type of eye tumor is metastatic—this is a secondary tumor caused by cancer that has spread from one part of the body to another, often coming from the lung, breast, bowel, or prostate.

Eye Tumors: Symptoms, Causes, Diagnosis, Treatment

Eye Tumors Tumors in the eye usually are secondary tumors caused by cancers that have spread from other parts of the body, especially the breast, lung, bowel or prostate. Two types of primary tumors arise within the eye itself and are known as retinoblastoma in children and melanoma in adults.

Eye Tumors - Johns Hopkins Hospital

Melanoma is a type of cancer that develops in the cells that produce melanin — the pigment that gives your skin its color. Your eyes also have melanin-producing cells and can develop melanoma. Eye melanoma is also called ocular melanoma. Most eye melanomas form in the part of the eye you can't see when looking in a mirror.
