The MRI table actually rotates from the horizontal position to a vertical position which allows pictures to be taken while the neck and low back are in a weight bearing state. This potentially demonstrates a disc herniation or "pinched" nerve that might otherwise not be seen with the usual MRI performed only in the lying down position.

The Stress Test MRI used to examine the lumbar spine visualizes the anatomy in both supine and weight-bearing positions, and shows increased pressure applied to the spine while standing. When the patient is lying down during a traditional supine MRI examination, stresses on the discs are slight or non-existent, and space for the nerves is increased within the spinal canal.

Open and Weight-bearing MRI for Lumbar Central Spinal Stenosis

OPEN INMOTION MRI is weight-bearing, this means the patient's position becomes an integral part of the exam's outcome. This is especially important for diagnosing musculoskeletal conditions. Since the force of gravity generates bio-mechanical changes in anatomy, INMOTION MRI in a natural, stand-up position allows physicians to attain important additional information compared to traditional MRI.

Two primary means of obtaining a stress MRI are accomplished through the use of an upright open-bore MRI scanner and a supine closed-bore scanner that may utilize a weight-bearing apparatus. Most commonly used for the knee, the upright open-bore scanner that may utilize a custom back support, enables the MR image to be acquired under physiologic, loaded and even flexed conditions 26 .
